Question: "wells will be analyzed for any compounds detected in the past".

Could you please clarify what this means...Do we analyze all the wells for all the compounds detected in all the past rounds OR do we analyze each individual well for only the compounds historically detected in it? If the latter, then what do we analyze the historically clean wells for?

Also, should it be "detected" or do you really mean "exceeded"? If the latter, do you mean the ES or PAL?

ANSWER: WELLS MUST BE ANALYZED FOR ANY COMPOUND DETECTED OVER THE PAL. CLEAN WELLS NEED TO BE ANALYZED FOR PVOC'S.
