Question: What is the approximate depth to groundwater?

Answer: The depths to groundwater at MW-6 were recorded to vary from approximately 8.5 to 9.5 feet below the top of the casing from 2000 to 2003. (The top of the casing was recorded at 0.09 feet below the ground surface.) The recorded groundwater depths at other wells in the area varied from approximately 7 to 11.5 feet below the top of the casings over that same time period.
