Does the 400 tons of soil related to the proposed excavation for the former Will Property include the contaminated soil that is beneath the former Will Meat Processing facility?

The amount of contaminated material to be removed (400 tons) was specified to allow bids to be compared more equally. The SI report estimates approximately 400 tons (pg. 12) of contaminated soil and saturated material exists on the property and the location of this material is shown on Fig. 7. Not all of this material may be accessible for removal due to the building foundation and the actual amount of soil removed may be less than 400 tons.
